Chapter 1

Mathematical Induction

1.1 Counting Regions in the Plane

A set of lines in the plane is said to be in **general position** if no two lines are parallel and no three lines intersect at a common point.

Guess: Adding one more line to $n - 1$ lines in general position in the plane **increases** the number of regions by n . In other words $T(n) = T(n - 1) + n$.

The base cases is trivial

- $T(0) = 1$
- $T(1) = T(0) + 1 = 2$
- $T(2) = T(1) + 2 = 2 + 2 = 4$
- $T(3) = T(2) + 3 = 4 + 3 = 7$

So we assume $T(n)$ is correct, now we want to prove $T(n + 1)$ is also correct. Let's remove line n^{th} . According to induction hypothesis Adding line $(n + 1)^{th}$ add n new regions. If we add line n^{th} again, it intersect with line $(n + 1)^{th}$ at exactly one point p . This point is located in region R .

In the absence of line n^{th} , line $(n + 1)^{th}$ adds only one new region when it passes R . But in presence of line n^{th} , it adds 2 new regions when it passes R . For other regions line $(n + 1)^{th}$ adds $n - 1$ new regions with or without the presence of line n^{th} . So line $(n + 1)^{th}$ adds $n - 1 + 2 = n + 1$ new regions when n^{th} is presented.
